

What is claimed is:

1. A method of manufacturing a wireless suspension blank using two-layer laminate composed of a metallic layer with the spring property and an insulating layer, the method comprising a first step for working the metallic layer by the photo etching method, a second step for forming a wiring part on the insulating layer by the semi-additive method and a third step for working the insulating layer by the wet-etching method.

2. A method of manufacturing a wireless suspension blank as claimed in Claim 1 wherein polyimide resin layer is used as the insulating layer.

3. A method of manufacturing a wireless suspension blank as claimed in Claim 1 wherein the insulating layer is wet-etched from the side of the metallic layer in wet-etching the insulating layer.

4. A method of manufacturing a wireless suspension blank as claimed in Claim 1 wherein wet etching is carried out from the side of the wiring part in wet etching the insulating layer.

5. A method of manufacturing a wireless suspension blank as claimed in Claim 1 wherein wet etching is carried out from both sides of the side of the metallic layer and the wiring part in wet-etching the insulating layer in wet etching the insulating layer.

6. A method of manufacturing a wireless suspension blank using a two-layer laminate being composed of a metallic layer with the spring property and an insulating layer, the method comprising a first step

for working the metallic layer by the photo etching method, a second step for forming a wiring part on the insulating layer by the semi-additive method and a third step for working the insulating layer by the plasma etching method.

7. A method of manufacturing a wireless suspension blank as claimed in Claim 6 wherein polyimide resin layer is used as the insulating layer.

8. A method of manufacturing a wireless suspension blank as claimed in Claim 6 wherein the insulating layer is worked by an electrode with the shape having the curvature in plasma etching the insulating layer.

9. A method of manufacturing a wireless suspension blank using a two-layer laminate composed of a metallic layer with the spring property and an insulating layer, the method comprising a first step for forming a wiring part on the metallic layer by the semi-additive method, a second step for working the metallic layer by the wet-etching method and third step for working the insulating layer by the dry-etching method or the wet-etching method.

10. A method of manufacturing a wireless suspension blank as claimed in Claim 9 wherein polyimide resin layer is used as the insulating layer.

11. A method of manufacturing a wireless suspension blank as claimed In Claim 9 wherein in the third step, a flying read part is formed.
